Principles of Pathology

In anemia diagnosis, the color characteristics of the eyelid, particularly the degree of pallor, are key indicators. In healthy individuals, the eyelid appears reddish, reflecting sufficient levels of hemoglobin in the blood. However, when anemia occurs, hemoglobin levels drop, and the color of the eyelid tends to become pale, as the blood's oxygen-carrying capacity decreases, affecting oxygen supply to tissues.

Technically, changes in eyelid color can be captured using image processing methods. Specifically, the image processing system can decompose the eyelid image into red, green, and blue channels, and compare the value of the red channel against other color channels. Studies have shown that anemic patients often exhibit lower red channel values, with RGB channel values being similar, causing the eyelid to appear pale or pinkish. This phenomenon serves as a potential indicator for quantifying hemoglobin levels, providing a non-invasive approach for evaluating anemia.

Image-based symptom detection

Application Principles

Data Preprocessing

To address the issue of glare in the images, we implemented two methods. First, we used the HSV color space to filter out glare points with excessively high brightness or low saturation. The second method involved converting the image to grayscale and using threshold operations to detect and correct over-bright areas.

During the image segmentation stage, the UNet model was employed to automatically segment the eyelid region, allowing for precise extraction of anemia-related features. The UNet architecture consists of an encoder and a decoder: the encoder progressively captures critical features within the image to locate the eyelid, while the decoder restores these features to accurately mark the eyelid area.

Deep Learning Classification

In deep learning classification, a deep learning model is employed to classify anemia images, using a hemoglobin (Hb) concentration threshold of 12 g/dL to determine anemia presence. The model leverages multi-level feature extraction to automatically identify anemia-related features, such as color variations in the eyelid area. To improve the model's generalization, data augmentation techniques are applied during training to diversify the dataset, enhancing the model's performance on new data and strengthening the stability and accuracy of the classification results. The model achieved an accuracy of 85% to 90% on the test set, demonstrating its reliability in anemia detection.

Regression Analysis

Regression analysis is used to quantify the severity of a patient's anemia by examining trends in hemoglobin levels. This analysis selects features closely related to eyelid color—such as hue, saturation, brightness, the R channel, the difference between R and GB channels, and grayscale—to estimate hemoglobin levels. Linear and polynomial regression models are employed to precisely predict hemoglobin fluctuations, while mean squared error (MSE) and the coefficient of determination (R^2) are used to assess model performance, ensuring both predictive accuracy and interpretability.

Clinical Trials

Our team, having received approval from the Institutional Review Board, has initiated clinical trials at Shuang Ho Hospital and the Hemodialysis Center of New Civil Hospital.

Certificate of TMU-JIRB Approval Issue Date: 2023/06/18

TMU-IRB No.: N20220187
Protocol Title: Detect the patient's jaundice and anemia with a smartphone
Principal Investigator: Fu-Wen Liu
CO-Investigator: Chang-chang-chun, Chiu-In Chou
Study Member: Xiang Jun, Zhang
Study Site: TMU/Shuang Ho Hospital/TMU-Hsin-Kuo-Min Hospital/TMU-Hsin-Kuo-Min Hospital
Protocol Version/Date: Version 6/0202/05/28
Informed Consent Form: Version 6/0202/06/07
Case Report Form: Version 2/8/2022/04/28

The above study will be approved by expedited review process of the TMU-Joint Institutional Review Board in meeting #11-07-2020-2023(07/12), duration of validity is from 2023/06/18 to 2023/06/17, and must be monitored by TMU-JIRB.

According to Ministry of Health and Welfare and the relevant regulations, follow-up procedures and requirements are as below:

- Continuing Report: Continuous report frequency is every 12 months. The report should be submitted in 2 months before the end of validity (2023-04-17). The trial study cannot going if the continuing report not approved yet.
- Final Report: The report should be submitted when the trial study complete. TMU-JIRB will withdraw the approval of this trial study if the report is not submitted final report within three months from the date of validity of this trial study. Also, request principal investigator's right of new trial study application in accordance with TMU-JIRB SOP for three months.
- Serious Adverse Events(SAE) Report: The investigator is required to report in accordance with "Regulations for Good Clinical Practice" and "Procedures for Reporting Serious Adverse Drug Reaction".

1.試驗/研究背景與試驗/研究藥品/器材產品現況:
貧血是一個全球性的公共衛生問題，對人體健康產生重大影響，世界衛生組織 (WHO) 估計約有 20 億人患有貧血症，其定義為血紅蛋白(hemoglobin, Hb) 濃度低於平均值。貧血被定義為血液循環的紅血球細胞減少(Hb) 濃度降低；因此，它使血液輸送氧氣的能力降低。這些因素可以單獨出現，但經常相互關聯。它也是學齡兒童和孕婦併發症死亡率增加的原因。2002 年，缺血性腎病被認為是造成全球血液病發的數量最顯著之一。貧血症發展後，通常情況下，Hb<9-10 克/升會出現明顯症狀，因為人體會執行代償機制，例如增加輸出的血量，通過这种方式釋放的氧氣量被確保不受影響。當代償不能跟足對氧氣的氣血時，就會出現疲勞、面色蒼白、易怒、心悸加劇、失眠、頭暈等多種症狀。不管貧血如何，由於嚴重程度的貧血會隨著體能的可用而並發成嚴重腎臟病等致命性生命狀況的跡象。在許多情況下，必須根據Hb水平對患者進行輸血。這種做法可以每天流動的幅度較大。貧血是通過測量血紅蛋白水平來評估的，血紅蛋白是紅細胞中的一種蛋白質，是負責可靠的載體，因為Hb為身體的所有細胞提供氧氣。診斷貧血的標準方法主要依賴於血液 Hb 的侵入性測定。複雜的採血會導致患者的不適

Clinical Trials

Phase Results

- To date, we have successfully enrolled over 350 participants, and recruitment is actively ongoing.
- A preliminary design for the measurement mobile application has been completed.
- An anemia detection model was initially developed with an accuracy of over 90%.

【57】申請專利範圍
1. 一種眼部影像擷取處理裝置，該裝置包含：一可攜式使用者裝置主體，其上設置有一影像拍攝模組，該影像拍攝模組用以拍攝一使用者之一眼部而產生一眼部影像資料，以及一種操作式，安裝於該可攜式使用者裝置主體中，用以接收該眼部影像資料並進行一資料處理，用以根據一檢閱狀態滿足足夠自拍產生一指示信號來指示該使用者完成自拍，進而產生對應該期間的一待診斷影像。
2. 如請求項 1 所述之影像擷取處理裝置，其中該應用程式中包含一色彩校正演算法，用以將自拍完成之一原始影像處理成接近真實顏色的該待診斷影像。
3. 如請求項 2 所述之影像擷取處理裝置，其中更包含一光譜感測晶片，該感測器至該可攜式使用者裝置主體，用以收集拍攝時的環境光之一光譜分布狀況，而該色彩校正演算法為一種環視光影響消除光譜法，其包含下列步驟：接收自拍完成之該原始影像；接收該光譜感測晶片收集之該光譜分布狀況，以及利用該光譜分布狀況來對該原始影像之色澤進行調整，進而達到將環境光對該原始影像之色偏影響消除而處理成接近真實顏色的該待診斷影像。
4. 如請求項 3 所述之影像擷取處理裝置，其中更包含一光源，該光源連接該可攜式使用者裝置主體，用以對該使用者之該眼部發光照射，使得該光譜感測晶片或該影像拍攝模組收集到至少包含兩種狀態：一第一狀態與一第二狀態，該第一狀態為該光源對該眼部照射，而該第二狀態為沒有光源對該眼部照射，而該第一狀態的影像資訊減去一第二狀態的成資訊，便可得到該原始影像之色偏影響消除的效果，而將該原始影像處理成接近真實顏色的該待診斷影像。
5. 如請求項 2 所述之影像擷取處理裝置，其中該色彩校正演算法則為一種環視光影響消除之自動色偏校正演算法，其包含下列步驟：接收自拍完成之該原始影像；以及利用一標準-11686-
